TOTAL LAND AREA AND MAJOR USES OF FARM LAND
IN ARKANSAS BY CIVIL TOWNSHIPS

By

Dean W. Blackburn
Land Planning Specialist for Arkansas
Fayetteville, Arkansas

The greatly increased activity in research in Land Economics during recent months and the administration of New Deal acts pertaining to agriculture make it important that many of the types of agricultural data be provided more generally on a minor civil division, which in Arkansas is the township basis.

Farm problems of many kinds are now being attacked on a regional basis. The Government has studied agricultural production from a regional standpoint contemplating adjustments in production on that basis. The Federal Soil Conservation Service has established a number of projects in recent years, particularly in the last four years, to demonstrate the various and most desirable means of solving the types of problems encountered in erosion control for the specific regions in which projects are located. Thus regional analysis of land uses and land-use problems has become more important today than at any previous time in the history of our country and this requires basic data on as small a unit as is reasonably possible.

The 1930 U. S. Census published certain types of data, including the major uses of farm land, by townships. The U. S. Censuses, however, have never published figures on total land area by townships. Such figures have not been available except when they could be worked up from records of the General Land Office Survey. Since roughly only one-half of the 33,616,000 acres of total land area in Arkansas is classed as farm land, it is important to have some method for determining where the non-farm land is located.

It is not enough in this respect to have data on a state and county basis. Many of the counties in the state contain lands of several types and uses. The counties north of the Arkansas River from Ft. Smith to Little Rock, for example, have good farm land in their southern parts but principally hilly to mountainous land in their northern parts. In other sections of the state also one part of a county may be highly developed in farming while other parts may be in woodland. If data are available by townships, the non-farm land may be localized or located more exactly.

Land Areas Determined by use of Planimeter

The most satisfactory way of arriving at accurate figures on the land area of each civil township would be to draw upon the General Land Office Survey records at the State Land Office. In this way land area to a frac-

tion of an acre can be determined. Suffice it to say, however, that for present purposes this time-consuming method could not be employed. A planimeter and a large minor civil division map were used to determine the areas. The steps involved may be described in detail as follows:

The area in square inches of each of the townships in a given county was "read" or measured with a planimeter on a large map. The map used was drawn to a scale of 1:500,000 and was prepared by the Bureau of Agricultural Economics of the United States Department of Agriculture, Negative 24653A. At least three readings of the instrument were taken for each township and the mean of the three most comparable readings was taken as the true area. By totaling the areas of all the townships in the county the total area of the county in square inches was found. The approximate land area of the county in acres was obtained from the 1930 United States Census. By dividing the total area in acres by the total area in square inches, the number of acres per square inch was secured. Then by using the factor so determined, the acreage of each township in the county was calculated. Similarly, the acreage of each township in all 75 counties of the state was found.

Application of Township Data on Total Land Area

Although admittedly inaccurate to a slight extent, the total land areas of civil townships as determined by use of the planimeter and a large scale map may be used to advantage for certain purposes, particularly for comparison of the major uses of land by townships. For example, it is possible for the first time to compare by townships the amount of farm land with that of non-farm land, and the amount of improved farm land with that of all unimproved land.

For these reasons Table 1, below, has been arranged to show the following data for the state, counties, and townships, of Arkansas:

- (1) Total land area
- (2) All farm land subdivided as follows:
 - (a) Crop land
 - (b) Pasture land
 - (c) Woodland not pastured
 - (d) Other land in farms
 - (e) Improved farm land

The data listed above were obtained as follows: (1) The total land area was determined by use of the planimeter and a large scale map. (2) All land in farms was copied directly from the 1930 U. S. Census. (2a) The figure for crop land was obtained by combining the three classes of crop land listed in the census; namely, "crops harvested", "crop failure", and "idle or fallow." (2b) The figure for pasture land was obtained similarly

by combining the three classes of pasture land listed in the census; namely, "plowable", "woodland", and "all other" pasture land. (2c) The column for woodland not pastured is the same as the census column entitled "woodland not used for pasture." (2d) The column on other land in farms is the same as the census column on "all other land in farms." (2e) The column for improved farm land was obtained by combining all crop land and the plowable pasture land reported separately by the census.

Figures 1, 2, 3, 4, and 5 at the end of Table 1, are state maps which have been prepared on the basis of these data and which show separately the following by townships:

- (1) Percentage of total land area in farm land
- (2) Percentage of farm land in crops
- (3) Percentage of farm land in pasture
- (4) Percentage of farm land in woodland not pastured
- (5) Percentage of total land area in improved farm land.

As indicated above, minor civil division data are of value in numerous ways to research in agricultural problems. For the sake of comparison with the maps based upon the major uses of land a small copy of the Arkansas Problem Area Map is included at the close of this report (Figure 6). Without any discussion of the purposes of this map or the basis for its construction, it should be evident that the maps based upon the major uses of land were of valuable assistance in its construction.

* In a few instances the total land area of townships, as determined by use of the planimeter, was less than the amount of farm land as reported by the census for these townships. Whenever this situation was encountered the planimeter estimates of total land area were rechecked. One possible explanation of this situation is that the census enumerators probably recorded the entire acreage of a farm as being within the same township as the homestead itself, when many times, no doubt, a substantial part of the acreage could have been actually in the adjoining township. Therefore, a total of the census figures for farm land might be larger than the planimeter figure for total land area in a township.
